3 Subsetting	2

1 Aims

The [R Learning Syllabus](#) is pretty much our first opportunity within [Exercism](#) to explore data science operations with dataframes. The traditional `data.frame` and newer `tibble` are included in the test runner, along with Tidyverse libraries such as `dplyr`, `readr`, `tidyr` and `forcats`.

In contrast, the [Python track](#) is beginner-biased (they get a *lot* of newbies) and limited to Core Python.

Hence this separate code playground, where it is possible to install extra packages and work across multiple languages (R, Python, SQL for starters).

The current ~~plan~~ vague aspiration cover all these combinations:

	R	Python
<code>data.frame</code>		
<code>tibble</code>		
Pandas		
Polars		
DuckDB		
PostgreSQL
